Adobe announced the release of **Adobe Lightroom 5** a few days ago. The new version is available for download, and Lightroom 5 presents a whole new level of functionalities along with some new user-friendly functions. Lightroom is one of the most popular RAW converters for photographers, which makes the update to version 5 much anticipated. I have used the Lightroom 5 beta version last month, which is before the final version's release, and I like what I saw for the future of the software application. Adobe Lightroom is pre-installed on most of the new Mac models, which makes the process of importing your images much easier. I am a certified associate member of AE and I use the version 29 tested. It is the only application that I can recommend such a big productivity hit, regarding speed. Here are my impressions:

- The shot on spot always works, and it is really fast. The best thing is the "smart" preview without any hit, the preview of the profile and the slider always works quickly (under three seconds for a portrait to a lucky keyframe) and your picture is immediately ready for your work. But it is true that for performances, AE is not as efficient as Photoshop, but in general, I can work without notice.
- Using this program is always a pleasure, you will be surprised with the ease. For example, I can easily and quickly add a frame to my project, add a new text with a stroke and combine them. I can control the name, the color, the basic shape of the element with the light weight of my mouse. Really, there is no limit to the possibilities. One limitation, however, lies in the file formats (.psd), which is not the best, but in general, it gives great flexibility.
- Another key option, for example, the "smart" preview can be also used to create basic videos (simple effects, a wave, a motion curve), a rapid shutter speed, the clarity, the speed and quality of the JPG preview (you can choose to have the JPG preview as full-screen or as a normal preview (which is slow). Finally, as I have said, the operating times of my files are really good, I did not have any error in the file formats. So this is really a program that you can make any variation, with a very good productivity.
- In general, it is also a very good working program that you can use at work. But, like the famous saying (or unhappily, it is a megapiano for all), there are no one-size fits all. It depends on your personal workflow and also where you work. A good example, I often use Animator Pro to create animated logo, eventually exported to an AE file. Right there, the limits of the format become apparent, and Photoshop becomes more efficient. As I said, this is a personal matter, but in this case, it is the opposite of what I wanted to say.
- Finally, I think that the prices are really attractive. The program is (in my opinion, it is) a cheaper version of photoshop (which is 35 € more) so the license (or so) premium is really over-rated. I think that this program is really good value. Andum, it is very easy to work on this tool.

This Adobe Photoshop tutorial is geared to the absolute beginner: there are no contortions in the tutorial. The tutorial assumes that you have some experience using an image manager and want to automate your editing. By the end of the tutorial, we'll hope you stop thinking about Photoshop and start thinking about the process of creating. Tags are a great way to organize your photos and we'll use them in this Adobe Photoshop tutorial. The best way to get yourself out of the "photographer mode" and into the "creator mode" is to think about the end result instead of where you are in the process. If you think about creating a new asset and developing it into a finished design for your client, that's a lot more likely to appeal to them than if you show them your photos and ask, is this the one? It's also a lot more likely to help you solve problems and to get into the "creator" mindset. **Fixing Exposure:** I have a little trick for fixing exposure: I usually use the eyedropper tool (located in the top right of the interface) to sample the lightest or darkest sections of a photo. Highlight these areas in the inspector and then use the eyedropper tool to sample the highlight and the shadow areas. Using this information I can adjust my exposure to get the best balance of exposure across the entire image. If you use the eyedropper tool, do not move the cursor part way through an image as this will sample that area of the image, not what you want. Photos. A photo, taken with a camera, scanned into the computer, sketched by hand, or digitally altered in Photoshop, can take on various forms. But regardless of how it differs, photography requires an outlay of time, energy, and money. So many new photographers naturally assume that they'll take their first pictures for free using disposable film or digital prints on a home printer. 933d7f57e6
